

1000Kelvin Environmental Policy:

We believe it is important that we commit to track, quantify, and publicly communicate our environmental footprint. We seek to manage consumption of energy and source more of our electricity from renewable sources and other reliable non-CO₂ producing energy sources.

We will continuously work to reduce our greenhouse gas emissions even as our infrastructure requirements grow. We have built a Greenhouse Gas calculator into our order process. Giving our customers the ability to offset the CO₂ with Carbon Offset when ordering. We also purchase Carbon offsets to cover our own shipping CO₂ output when we deliver products to the customer. A link to how we manage our CO₂ offsets is provided below.

As a global marketplace company, we recognize that our business impacts the planet. We strive to operate our business with an environmentally sustainable process that benefits all our stakeholders.

For instance, we invest in technology and video conferencing to enable employees to conduct quality audits and inspection without jeopardizing the quality our customer's demand. This allows us to reduce business travel and shipping both of which help reduce our environmental impact.

Engaging our employees and stakeholders, and collaborating with other organizations and businesses, to advance progress on environmental issues, including, but not limited to, renewable energy purchases, energy and climate change legislation, circular commerce, and greenhouse gas reductions complying with applicable environmental legislation, regulations, and requirements where 1000Kelvin operates.
